Experiment Card

Plan every experiment before it runs. Setting your success line in advance keeps you from moving the goalposts once results come in.

1. Assumptions

List at least eight assumptions your venture depends on.

Rank them by importance and by how much real evidence you have.

Which assumption is most important and least proven?

2. Hypothesis and test

We believe that [customer] will [action] because [reason].

What is the cheapest test that could prove this wrong?

What will you ask people to do, not just say?

3. Metric and success line

What exactly will you measure?

What result counts as a pass? What result means rethink?

When will the test start and end?

4. Results log

Record your results each day of the test.

What surprised you, even if it was outside your metric?

Did anything outside your control affect the result?

5. Decision

Persevere, adjust or change direction? Explain why.

What will you test next?
