Pricing Experiment Plan

Replace a guess with evidence. Build a price range from three lenses, then test real prices with real customers.

1. Your price range

Cost floor: what does one unit cost you to deliver, including your time?

Competitor reference: what do customers pay for the current alternative?

Value ceiling: what is the outcome worth to the customer?

2. Test design

Which two or three price points will you test?

Which format will you use: split test, sequential test, tiered offer or pre-order?

How will you make sure each customer sees one clear, fair price?

3. Metrics

What will you measure at each price: sales, revenue, profit per hour?

What is your success line?

How long will the test run, and how many people need to see each price?

4. Results and recommendation

Record sales, revenue and customer comments at each price.

Which price earned the most per customer and per hour of your time?

What price will you use next, and what will you test after that?
